Introduction

Monarch Server Report Mining Server (RMS) Edition can be used through an initiation request. The request is sent using the HTTP POST method. It can be generated in a client browser by sending an HTML form with the fields named according to the corresponding parameters of the initiation request.

The initiation request contains instructions to determine the type of presentation to be provided. The type of presentation can be either a full interactive mining application for the user to select views, or it can be a session-less request to publish a single export of data based on a predefined set of mining rules to a particular data format.

Monarch Server Report Mining Edition

Interactive Mining

RMS recognizes the request and then queries the report, model, and template data to determine the user’s available views.

The initiation request contains the following information:

- **Initiation Request Type.** A request to provide a full interactive mining application.
- **Report Retrieval information.** This is a complete resolvable path to a source report to be used by RMS.
- **Model Retrieval information.** A complete resolvable path(s) to models to be used by RMS. A folder path is allowed. The folder shall be scanned for .xmod files to obtain a list of all available models.
- **Template Retrieval information** (Excel templates and ES Style style sheets). Provides complete resolvable path(s) to templates to be used by RMS.
- **Model to Template associations.** The templates of types Excel and ES Style shall be associated with a particular model for correct data extraction and processing.
- **The List of Allowed Views.**
- **User ID.** User identifier.
- **Document Type ID.** Server Library Folder identifier.
- **Default View.** The initial view to be presented to the user. The user can navigate to other available views.
- **Dynamic filter.** The initial dynamic filter for Data, Summary, and ES Style Views.
Monarch Server Report Mining Edition

Export View Request

RMS recognizes the request and then publishes the data in the format defined by the initiation request.

The initiation request contains the following information:

- **Initiation Request Type.** A request to provide a single export of data.
- **Report Retrieval Information.** This is a complete resolvable path to a source report to be used by RMS. Multiple report segments can be specified for processing. They will be concatenated together and then processed.
- **Model Retrieval Information.** A complete resolvable path to a model to be used by RMS.
- **Template Retrieval Information** (Excel templates and ES Style style sheets). Provides complete resolvable path to a template to be used by RMS.
- **Model to Template Associations.** The templates of types Excel and ES Style shall be associated with a particular model for correct data extraction and processing.
- **Data View.** The format of the single export view to be provided to the user.
- **User ID.** User identifier.
- **Dynamic filter.** The initial dynamic filter for Data, Summary, and ES Style Views.

Entry Point for Initial Request

The initiation request is sent to the RMS entry point. The URL of entry point is

http://<host name>:<portnumber>/

<RMS virtual directory>/RequestTypeAnalyze/AnalyzeRequest

where

- `<host name>` is the name of the computer where the target Monarch Server RMS WebServer component is installed
- `<port number>` is the port number on which the RMS WebServer is listening
- `<RMS virtual directory>` is the virtual directory under which the application is installed (RMSClient by default).

The request is sent using the HTTP POST method. All parameters are passed as the fields of the POST request.

The request’s response will be HTML, PDF, CSV, XLS(X), PRF content, or an HTTP error.
# Request Parameters Reference

## Quick Reference Sheet

<table>
<thead>
<tr>
<th>PARAMETER NAME</th>
<th>TYPE</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>REQUEST_TYPE</td>
<td>O</td>
<td>Type of request. Valid values are &quot;I&quot; for interactive or &quot;E&quot; for a single export view of mined data. If the type is not specified, the default type is set to interactive.</td>
</tr>
<tr>
<td>REPORT_PATH</td>
<td>M,M</td>
<td>Complete resolvable path to the source report(s). Paths to multiple reports are separated with a semicolon. Can be a local path (accompanied by a host name passed via REPORT_HOST) or a UNC path.</td>
</tr>
<tr>
<td>REPORT_HOST</td>
<td>O,O</td>
<td>Name of the host where the report is located. If the report host is not set, then the report path must be a UNC path to be equally accessible to any exporter.</td>
</tr>
<tr>
<td>MODEL_PATHS</td>
<td>M,M</td>
<td>Complete resolvable path to the source models (non-template-bound) or a model definition ID. RMS supports the following formats for this parameter: path to a single model list of paths to the models. This list should be in the following format: <code>&lt;model_1_path&gt;;&lt;model_2_path&gt;;... &lt;model_n_path&gt;</code> path to the folder which contains models model definition ID This parameter should list only table/summary models and not template-bound models. The template-bound models should be specified in the TEMPLATES_MODELS parameter.</td>
</tr>
<tr>
<td>TEMPLATE_PATHS</td>
<td>O,O</td>
<td>Complete resolvable path to the source templates or a template definition ID. RMS supports the following formats for</td>
</tr>
</tbody>
</table>
this parameter:

- path to a single template
- list of paths to the templates. This list should be in the following format: `<template_1_path>;<template_2_path>;...<template_n_path>`
- path to the folder which contains templates
- template definition ID

If this parameter is absent, XFORM data views should not be available.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEMPLATES_MODELS</td>
<td>O</td>
<td>O</td>
<td>The list of model-to-template associations. Paths or object definition IDs can be used. Parameter format: <code>&lt;template_1_path&gt;;&lt;model_1_path&gt;;...&lt;model_n_path&gt;</code></td>
</tr>
<tr>
<td>CHECKSUM</td>
<td>M</td>
<td>M</td>
<td>Contains digital signature for initiation request's parameters.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>M</td>
<td>M</td>
<td>User identifier. This identifier used for getting user preferences and for authentication.</td>
</tr>
<tr>
<td>USER_PASSWORD</td>
<td>O</td>
<td>O</td>
<td>User password. If a password is not provided, a new dynamic user is created in the RMS DB. This user is assigned to the user group that is specified in the web.config file of the RMS Client. If a password is provided, the user with the USER_ID and PASSWORD should already exist and be assigned with the RMS user privilege to login to RMS Client.</td>
</tr>
<tr>
<td>DOCTYPE_ID</td>
<td>O</td>
<td>N/A</td>
<td>Server Library Folder identifier. If a Server Library Folder identifier is provided, all the models and templates contained in the folder are made available to the user (if the user has the necessary access permissions). This identifier is also used when the user saves a model to the server. If DOCTYPE_ID is not provided, the model cannot be saved to the server. If DOCTYPE_ID is provided, then the model can be stored in RMS and can be</td>
</tr>
<tr>
<td>Parameter</td>
<td>Mode</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>------</td>
<td>---------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DYNAMIC_FILTER</td>
<td>O</td>
<td>O</td>
<td>The initial dynamic filter for Data, Summary, and ES Style Views. It consists of a value pair of column name and filter value: FILTERCOLUMN=[ColumnName];FILTERVALUE=[FilterValue];FILTEROPERATOR=[EQ,NEQ,GT,LT,GTE,LTE,CONTAINS,STARTSWITH,ENDSWITH] The date format for the filter value is YYYYMMDD.</td>
</tr>
<tr>
<td>ALLOWED_VIEWS</td>
<td>O</td>
<td>N/A</td>
<td>The list of data views that should be available for the user. Parameter format: &lt;data_view_1 &gt;;&lt;data_view_2&gt;;... &lt; data_view_n&gt;, where &lt;data_view_n&gt; is one of the following constants: HTML_REPORT DYNAMIC TABLE SUMMARY XLS_TABLE XLS_SUMMARY PRF XFORM REMOTE_PORTLETS</td>
</tr>
<tr>
<td>TIMESTAMP</td>
<td>M</td>
<td>M</td>
<td>Timestamp of the request. This is the number of milliseconds that has elapsed since Jan 01, 1970 (Java-style date/time representation)</td>
</tr>
<tr>
<td>JOINPASSWORD</td>
<td>O</td>
<td>O</td>
<td>Join password for logging into an external data source.</td>
</tr>
<tr>
<td>DEFAULT_VIEW</td>
<td>O</td>
<td>M</td>
<td>Name of the view to show initially. Default is the Welcome page. The view name can be one of the values permitted for the ALLOWED_VIEWS parameter or the “WELCOME” value for the Welcome page. The parameter is mandatory for export type request to identify the requested view.</td>
</tr>
<tr>
<td>EXPORTTO</td>
<td>N/A</td>
<td>M</td>
<td>Defines the format of the exported view. Can be one of the following: For HTML_REPORT: PDF HTML For TABLE: PDF</td>
</tr>
<tr>
<td>Setting</td>
<td>Value 1</td>
<td>Value 2</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>

<tr>
<td>DELETE_REPORTS</td>
<td>O</td>
<td>O</td>
<td>Report removal flag. Set to “true,” “1”, or “on” to remove source report after user session ends.</td>
</tr>
<tr>
<td>DELETE_MODELS</td>
<td>O</td>
<td>O</td>
<td>Model removal flag. Set to “true,” “1”, or “on” to remove source models after user session ends.</td>
</tr>
<tr>
<td>DELETE_TEMPLATES</td>
<td>O</td>
<td>O</td>
<td>Template removal flag. Set to “true,” “1”, or “on” to remove source templates after user session ends.</td>
</tr>
<tr>
<td>ADMIN</td>
<td>O</td>
<td>N/A</td>
<td>Admin mode flag. Set to “true,” “1”, or “on” to allow uploading shared models and deleting models.</td>
</tr>
<tr>
<td>REPORT_ENCODING</td>
<td>O</td>
<td>O</td>
<td>Encoding of incoming reports. Can be one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- ANSI</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- ASCII</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- UTF8</td>
</tr>
<tr>

<td></td>
<td></td>
<td>- UTF16LE</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- UTF16BE</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If the value is not defined or invalid, ANSI will be used.</td>
</tr>
<tr>
<td>LOCALE</td>
<td>O</td>
<td>O</td>
<td>The locale to be used in the current session. Can be one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- en (English)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- fr-FR (French-France)</td>
</tr>
</tbody>
</table>
Passing Report Paths

The REPORT_PATH should be a local path at the report storage machine, the host name of which is REPORT_HOST. The parameter may include a path to one report or to multiple reports, in which case the paths must be separated by semicolons. The RMS will access the report(s) directly in the following occasions:

- The Monarch Server Report Mining Edition that is performing the data processing is located at the machine described by the REPORT_HOST parameter.
- REPORT_PATH is a UNC path.

In all other cases, the RMS searches for the RmsContentServiceHost component to perform report data transfer.

Checksum Generation

The initial request is protected by a checksum — a type of digital signature.

The generation of a checksum includes computing a secure hash for significant attributes of the current request and then signing this hash with a secret key using an XOR operation.

The digital signature should be hex-encoded into symbolic representation before passing into RMS.
CODE EXAMPLE — HASHING A MESSAGE

To create a hash message, the request’s parameters should be concatenated into one string in the following order: timestamp, report path, model path, template path, allowed views. The code below shows a simple C# function for generating a hash message:

```csharp
// Create message for hash function
public static string GetHashMessage(
    long timestamp,
    string host,
    string reportPath,
    string modelPath,
    string templatePath,
    string allowedView)
{
    StringBuilder sb = new StringBuilder();
    // Concatenate all parameters into one string
    sb.Append(timestamp);
    sb.Append(host);
    sb.Append(reportPath);
    sb.Append(modelPath);
    sb.Append(templatePath);
    sb.Append(allowedView);
    // Return result
    return sb.ToString();
}
```

RMS supports all hash algorithms from the C# library. The algorithms are as follows.
The active algorithm can be set via RMS’s configuration file.
Below is a simple C# function for hashing a message:

```csharp
// Hashing
private static byte[] GetHash(string message, string hashAlgorithmName)
{
    byte[] buf = Encoding.UTF8.GetBytes(message);

    // Create hash algorithm instance
    HashAlgorithm algorithm = HashAlgorithm.Create(hashAlgorithmName);
    // Hash message
    return algorithm.ComputeHash(buf);
}
```
The hash shall be encrypted by an XOR operation with a secret key. The secret key’s length is large enough to provide strong encryption. The key can be set differently for every instance of RMS to increase security. It is stored in the RMS configuration file and can be changed by the administrator.

Below is a simple C# function for hash encryption:

```csharp
public static String Encrypt(String message, String watermarkString, String hashAlgorithmName)
{
    byte[] hash = GetHash(message, hashAlgorithmName);

    byte[] watermarkKey = StreamHelper.HexStringToByteArray(watermarkString);
    // Check key Length
    if (hash.Length > watermarkKey.Length)
    throw new RmsWebServerException("Incorrect \"watermark\" key.");
    // XOR
    byte[] encryptedHash = new byte[hash.Length];
    for (Int32 i = 0; i < hash.Length; i++)
    {
        encryptedHash[i] = (byte)(hash[i] ^ watermarkKey[i]);
    }
    // Return result
    return StreamHelper.ByteArrayToHexString(encryptedHash);
}
```
